# How much did the room cool overnight?

**SCOPE OF THE UNATTENDED RECORD**

One indoor point in one weather window. No official EPC, BER, DPE, SAP/RdSAP, HEM or DEAP assessment. No RICS/SCSI survey, thermographic inspection or U-value test. The statutory certificate remains separate.

## Illustrative result

## 20.1°C to 18.2°C over eight hours

The example room cooled at an average of −0.24°C per hour from 22:30 on 2 November to 06:30 UTC on 3 November. Heating off and outdoor air at 3.8°C are scenario assumptions. No physical unit supplied these values.

## Indoor thermal and moisture readings

| | |
|---|---|
| **Seven-night mean cooling rate** | -0.24°C/h · change in room air temperature |
| **Room air / relative humidity** | 19.4°C mean · 64.8% mean RH |
| **Calculated air dew point** | 12.6°C mean |
| **Air minus calculated dew point** | +6.8°C mean across all 2,016 intervals |
| **Surface temperature / condensation** | Unmeasured. Surface margin and hours cannot be determined. |

## Limitations of automated readings

Heating schedules, ventilation, occupants, sunlight and outdoor weather influence room air. The trace cannot establish insulation thickness, fabric heat loss, energy bills, a property value or the absence of damp. Placement requires express owner permission. RippleXn has not inspected the property, supervised placement or provided accredited calibration. It gives no opinion on the cause or legal meaning of any reading.

Only indoor air temperature and relative humidity are inputs to this base report. Any light or numeric sound logging uses an optional external boundary module. This example includes neither channel.

# Five-minute room chronology

**SCOPE OF THE UNATTENDED RECORD**

One indoor point in one weather window. No official EPC, BER, DPE, SAP/RdSAP, HEM or DEAP assessment. No RICS/SCSI survey, thermographic inspection or U-value test. The statutory certificate remains separate.

**Rows 481 to 528 of 2,016 / all times UTC**

Air and RH apply at interval start. A midnight end or receipt belongs to the next date.

Dew point is calculated from air and RH. Air minus dew point is the indoor air dew-point depression.

# Five-minute room chronology

**SCOPE OF THE UNATTENDED RECORD**

One indoor point in one weather window. No official EPC, BER, DPE, SAP/RdSAP, HEM or DEAP assessment. No RICS/SCSI survey, thermographic inspection or U-value test. The statutory certificate remains separate.

**Rows 1,057 to 1,104 of 2,016 / all times UTC**

Air and RH apply at interval start. A midnight end or receipt belongs to the next date.

## How to read these figures

Each nightly rate is the difference between the room readings at 06:30 and the preceding 22:30, divided by eight hours. It is an observed rate over that window, with no weather correction. In this fictional example every window has its 97 endpoint-inclusive readings, spanning 96 intervals.

Dew point uses the Magnus approximation over water (17.62 and 243.12°C), applied to room air and relative humidity. Air minus dew point gives air dew-point depression. A wall can be much colder than room air. Measuring its surface is necessary to estimate the margin at that wall.

A missing interval would be shown as missing in a field file. A receipt over five minutes after its interval end would count as delayed. All 2,016 generated intervals appear once in this file.

**DOCUMENT INTEGRITY CHECK & TECHNICAL NOTE FOR REVIEWING PARTIES**

The free verifier compares the file you hold with the registered example. The printed digest covers the downloadable source CSV. The final PDF digest is available separately. This teaching example contains no hardware transmissions. A field-file check concerns the electronic record only. The service cannot verify physical placement or the source of changes.

Each indoor point reflects its immediate surroundings. Dutyholders may keep separate, independent records on their own premises through prooftimeline.com.
